

UTILITY DISCONNECTIONS IN THE REGION (DRAFT ANALYSIS)

Leah Boggs
Senior Environmental Planner

Madalyn Stoddard
COG Intern

Built Environment and Energy Advisory Committee
June 18, 2026

National and State Profiles: 2024

- Nationwide
 - 15 million household disconnections
 - Electric: 13.4 million
 - Gas: 1.7 million
 - 17% never reconnected
- DC
 - Total Disconnections: 14,931
 - Electric: 11,976
 - Gas: 2,955
 - Total Reconnections: 7,850 (17%)
 - Electric: 6,444
 - Gas: 1,406

National and State Profiles: 2024

- MD
 - Total Disconnections: 50,012
 - Electric: 42,603
 - Gas: 7,409
 - Total Reconnections: 41,360 (83%)
 - Electric: 35,627
 - Gas: 5,733
- VA
 - Total Disconnections: 374,841
 - Electric: 368,427
 - Gas: 6,414

Data Source – Context

- Utility Disconnection: a deliberate interruption or limitation of a customer's utility service by the serving utility company, due to nonpayment.
- All data is from the [Utility Disconnection Dashboard](#), which gathers from utility reports, data received from open records requests from municipal utilities, or data shared from partners.
- This presentation only uses data from utility providers that operate in COG's region; however, this does not mean the data *only* includes COG jurisdictions.
- Additional slides with information regarding energy burden available at the end of this presentation.

Washington, D.C.

Electric Disconnections (Total)

Electric Reconnections (Total)

- The gap between disconnections and reconnections appears to be widening, with reconnection rate of 87.5% in 2016 lowering to 53.8% in 2024.

Maryland

Electric Disconnections (Total)

Electric Reconnections (Total)

- Disconnections appear to be on a steady upward trend, with less of a disconnection gap, as there was a reconnection rate of 88.7% in 2016, and 83.6% in 2024.

Virginia

Electric Disconnections (Total)

Electric Disconnections (Median)

- Reconnection data is not available for Virginia.
- Disconnections have remained relatively stable, with a rise in 2024, yet the median monthly disconnection was much higher pre-Covid-19.

Gas Disconnections (Total)

Washington, D.C.

Maryland

Virginia

Data Trends of Interest

- There is a consistent gap between disconnections and reconnections.
- Utility disconnections are steadily rising since Covid-19 era moratoria came to an end, and we expect continued increases as utility prices increase.
- Virginia's pre-Covid-19 median is much higher than post-Covid-19.
- Gas disconnections appear to be on a downward trend in recent years.

Conclusion

- Questions to consider:
 - How is energy burden moving upward through income classes?
 - How are energy assistance programs continuing to support households, and how can they ensure they are helping all in need?
