

THE NEXUS OF CORPORATE AND MUNICIPAL WATER CHALLENGES

IDENTIFYING OPPORTUNITIES FOR COLLABORATION

LimnoTech 

AGENDA

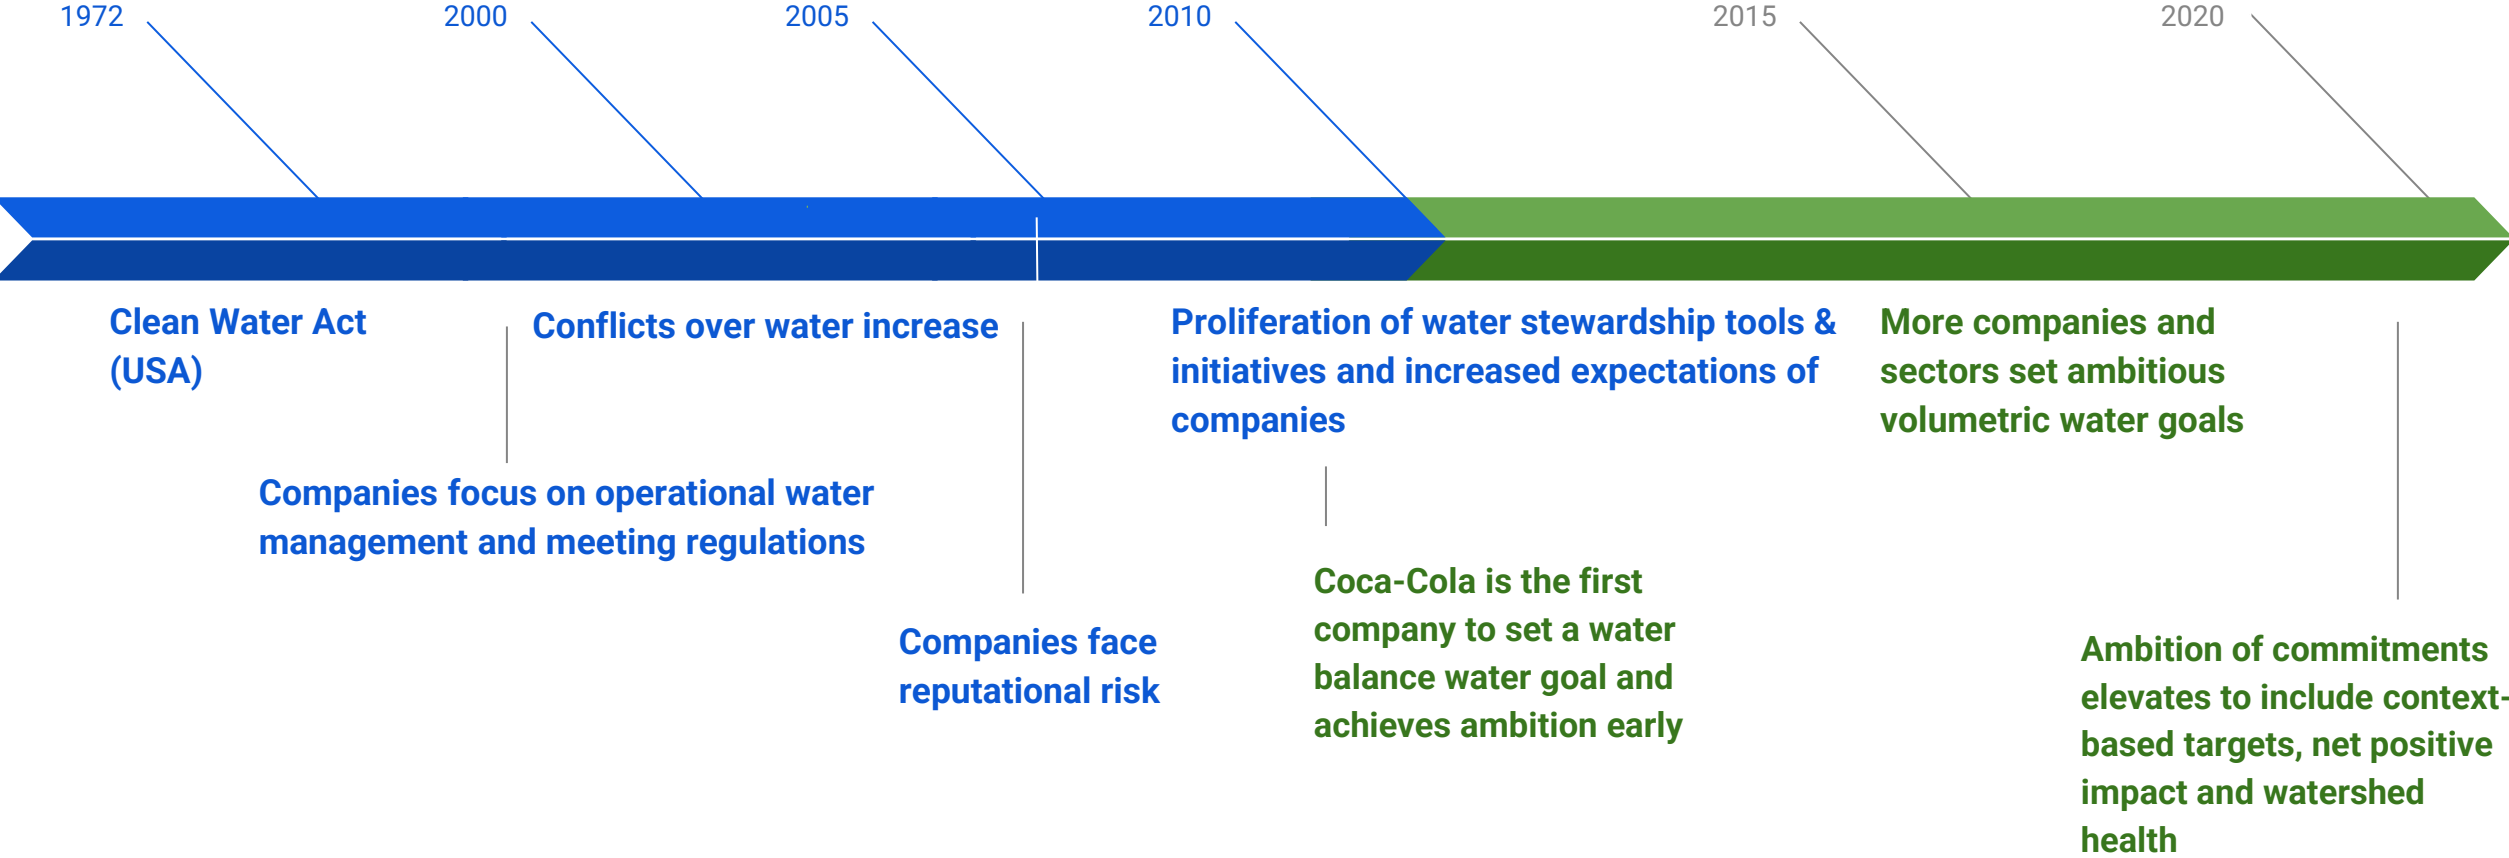

- Evolution of the corporate water landscape
- Municipal and corporate water management
 - Challenges faced
 - Synergies in addressing shared water challenges
- How potential projects are evaluated
- Examples applications & DOEE case study
- Summary and questions

WHY?

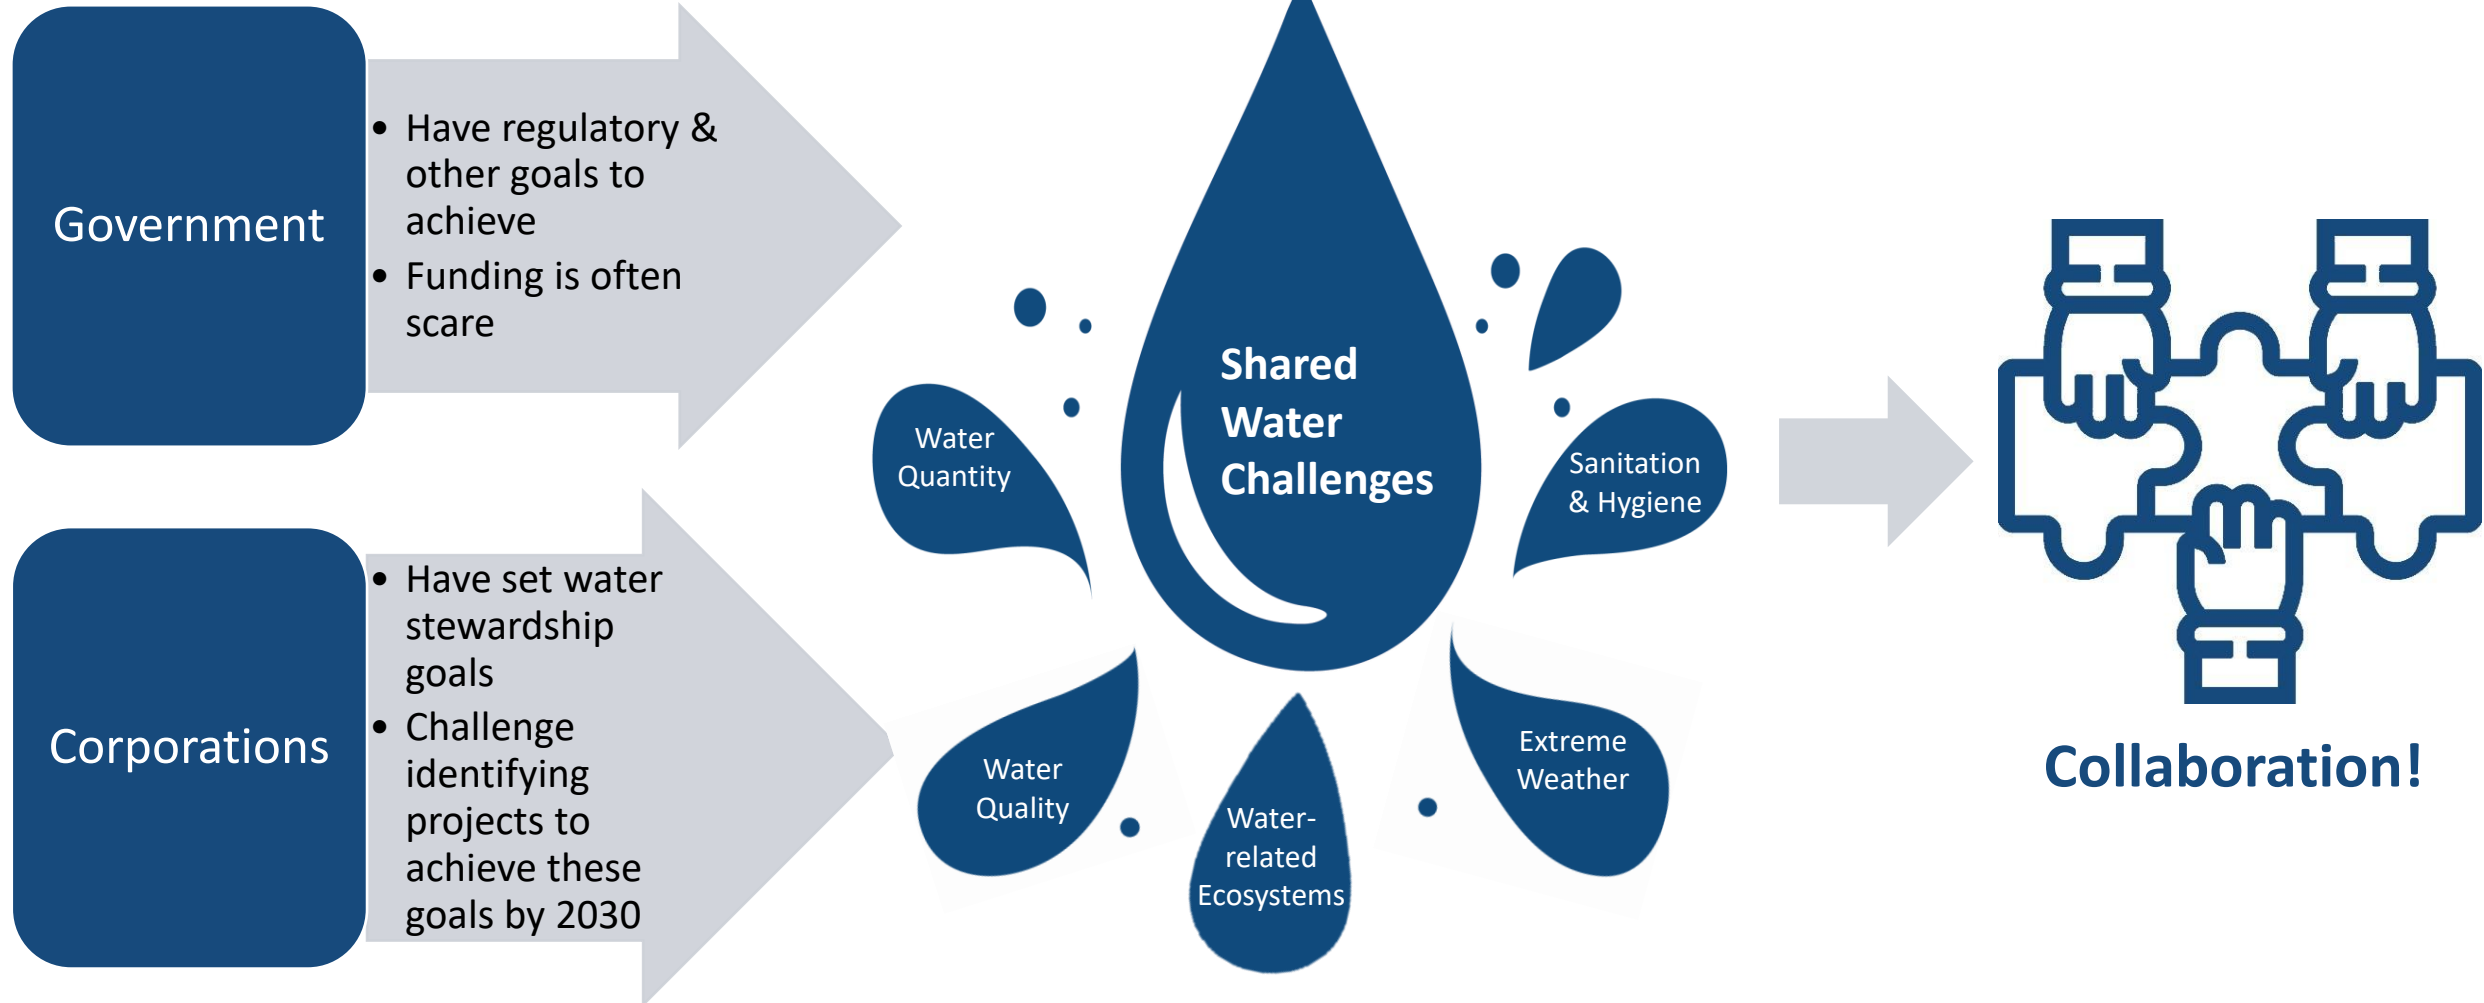

Timeline of Corporate Water Landscape

Evolution from **operational water management** to **water stewardship**

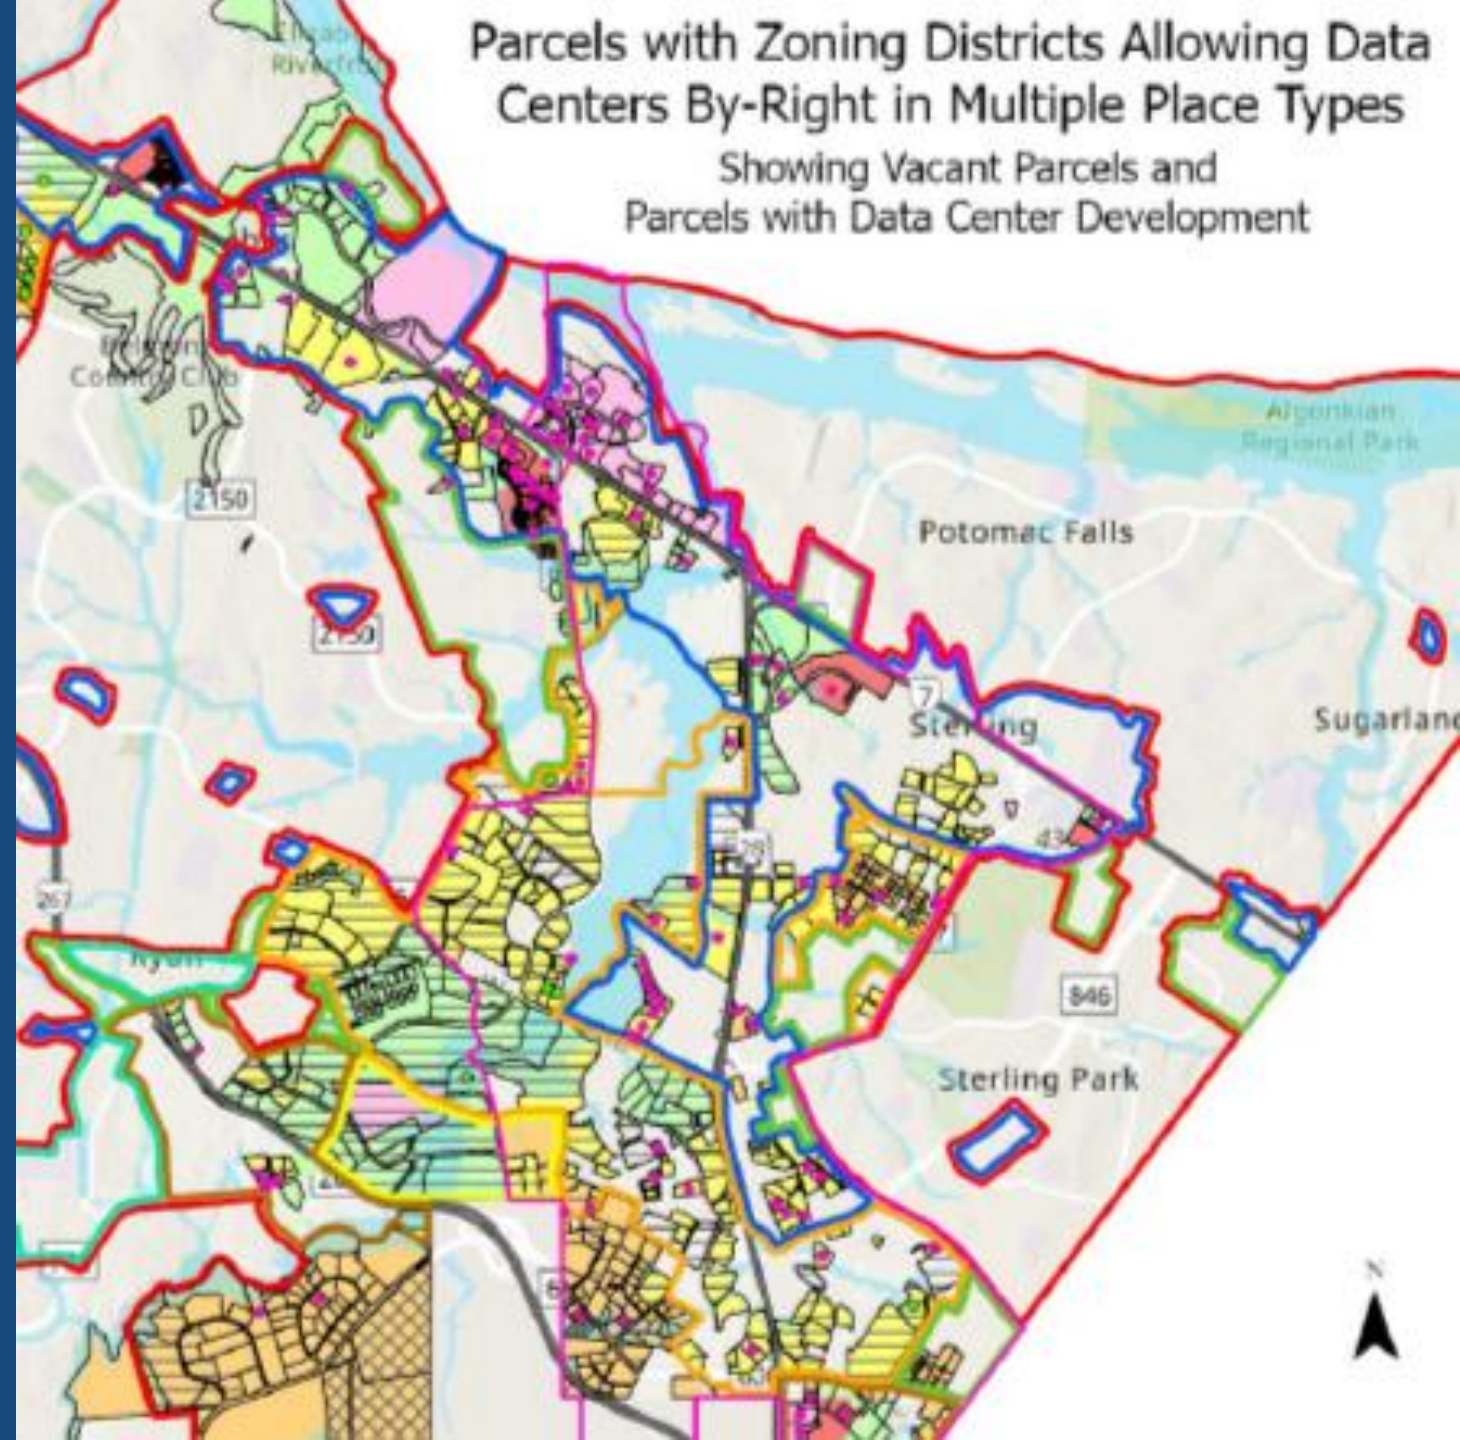

Municipal & Corporate Water Management

Municipalities:

- Must meet regulatory requirements by set deadlines
- Have limited funding to implement projects
- May have already identified potential projects or needs in previously developed plans (e.g., Master Plan, CIP, MS4 Program Plan, Needs Assessments)

Corporations:

- Technology, food and beverage, pharmaceutical, textile, and other companies located around the United States and around the world have set sustainability goals
- Are looking for projects to:
 - To help “offset” (replenish) water used in manufacturing, operations, etc.
 - Address other co-benefits (public need, ecological, etc.)
- Often have funding for projects

2030: Aim to return a cumulative total of **two trillion liters** of water to nature and communities globally.

Work with partners to help improve the **health of 60 watersheds** identified as most critical for the company's operations and agricultural supply chains.

2030: Replenish 120% of the fresh water they consume, on average, across all Google offices and data centers, and **improve the health of the local watersheds** where office campuses and data centers are located.

2025: 100% of communities in high-stress operating areas will have measurably improved water availability and quality and 100% of our direct farmers will have **measurably improved water availability and quality**.

2030: Enable **restoration of 600 billion liters of water** and **reduction of 5,000 metric tons of water pollutants** in water-stressed regions and enable improved access to safe drinking water and sanitation, reaching 500,000 people in priority communities.

2030: Achieve a **net-positive water impact** in our operations. Replenish greater than 50% of water withdrawal at sites that operate in high-risk watershed and **reduce water withdrawal by 40%** per unit of production across our enterprise.

2030: Reduce water consumption across our global operations and be water positive, **replenishing more water than we use**.

2030: 50% of water withdrawal will be **conserved or replenished** across their direct operations, stores, packaging, and agricultural supply chain from FY19, prioritizing action in high-risk water basins while **supporting watershed health, ecosystem resilience, and water equity**.

Business Case for Corporate Water Stewardship: Water Risk

Water risk stems from watershed context:

- Companies face water-related risks that **cannot be resolved solely through operational** water management.
- Many companies invest in both **technology and watershed health** projects in the watersheds they rely on to mitigate risks

A responsible business should:

- Use the resource **as sustainably as possible**
- **Look beyond the fence line** for collective action initiatives that are impactful at the watershed scale
- **Engage with stakeholders** to address shared water challenges
- Aspire to achieving a **net positive impact**

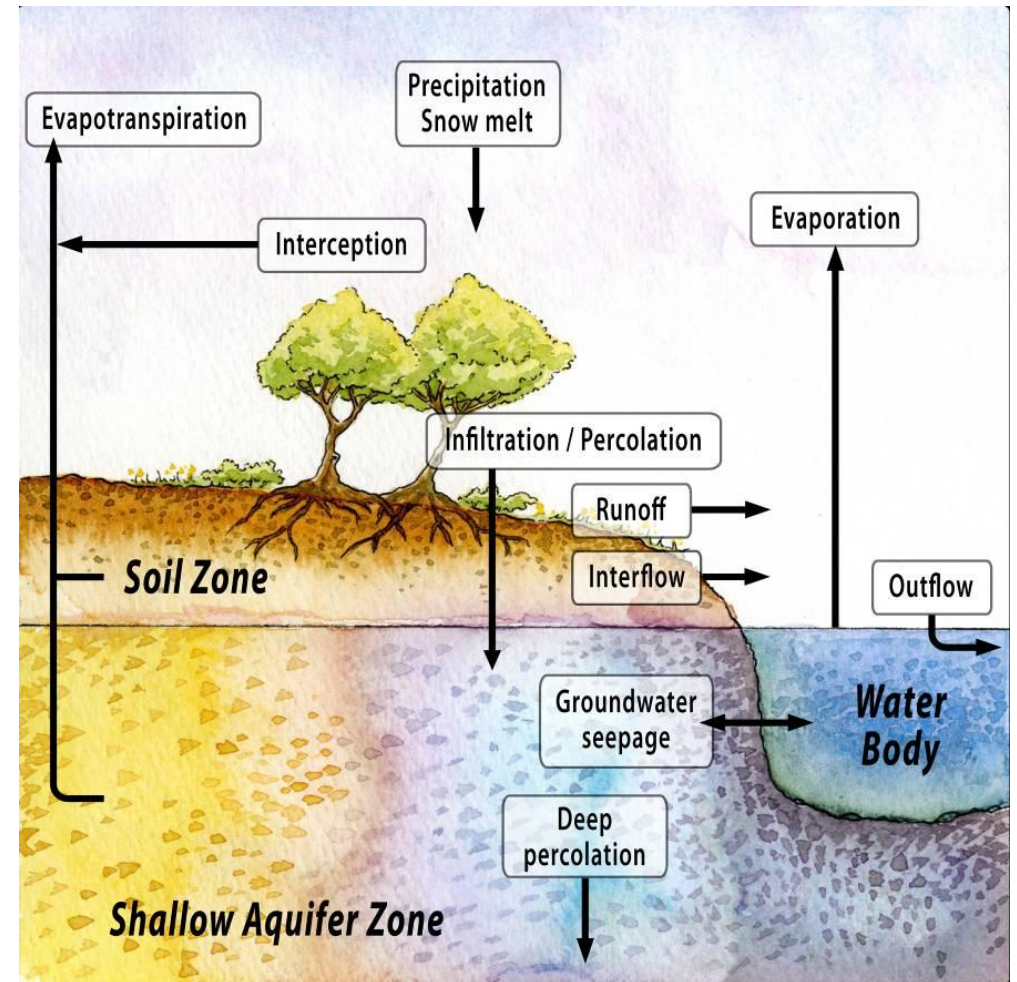

HOW?

WHAT IS “REPLENISH”?

- Companies commonly set targets that “**balance**” their consumptive water use
- Typically achieved through off-site water stewardship projects that yield **volumetric water benefits (VWBs)**, along with on-site efficiency projects that reduce consumptive water use
- Volume benefit that is counted against the corporate target is often referred to as a “replenish benefit”

VWB: The volume of water resulting from water stewardship activities, relative to a unit of time, that **modifies the hydrology in a beneficial way** and/or **helps reduce shared water challenges**, improves water stewardship outcomes, and meets the targets of Sustainable Development Goal 6
([Reig et al., 2019](#))

QUANTIFYING PROJECTS

Guidance for implementing, evaluating, and claiming volumetric water benefits of water stewardship projects

- Consistent methodology used across corporate replenish programs
- Applicable across a range of complex and diverse project types and geographies
- Project eligibility criteria and selection considerations
- Principles for making credible VWB claims and tracking and reporting
- Updated VWB calculation methods in 2025 release

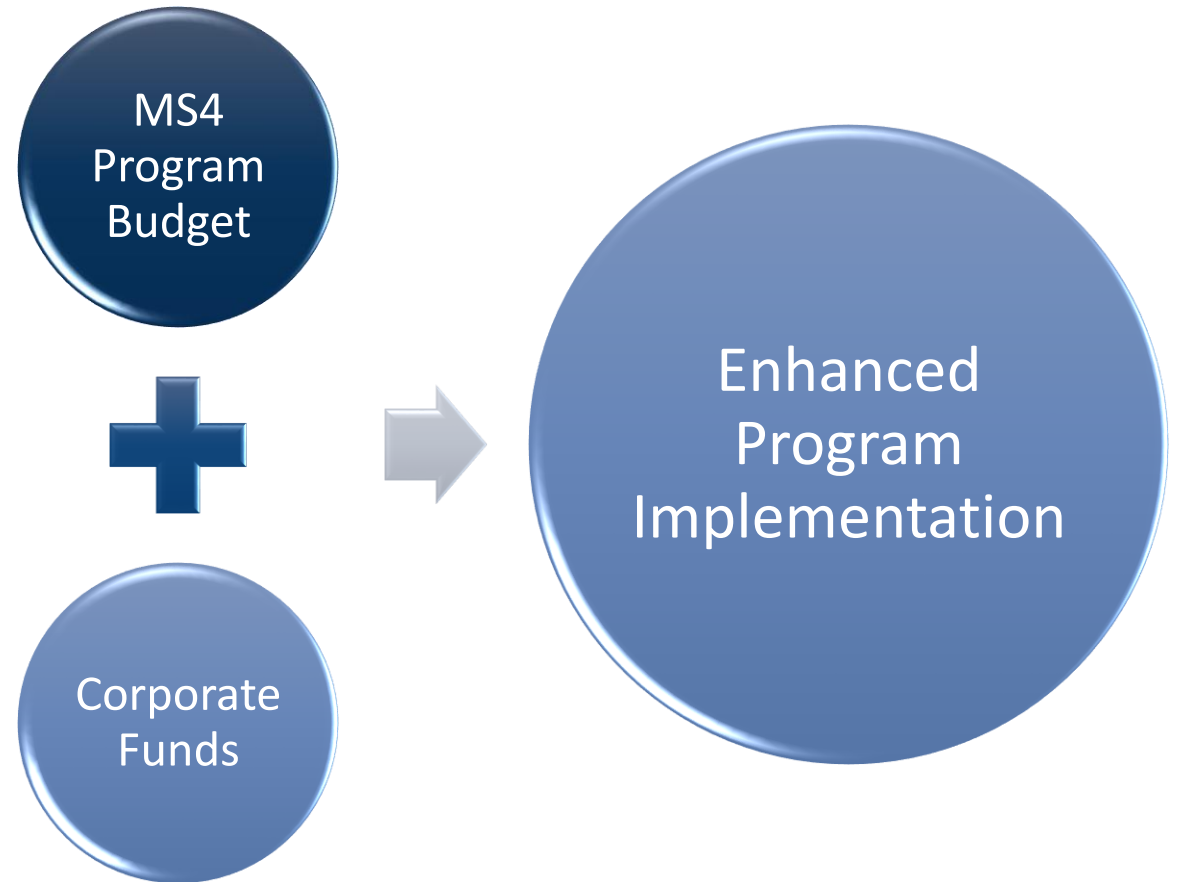

<https://www.wri.org/research/volumetric-water-benefit-accounting-2-0>

Factors for Consideration

- **Additionality (aka “added value”)**
 - Going beyond what is required by regulations or “business as usual”
- **Capital Stacking**
 - Combining sources of funding
- **Collaboration with NGOs**
 - Opportunities for improved communication and relationships
 - Mechanisms for the flow of funding

Principles for Determining Water Stewardship Project Eligibility

Source: [Volumetric Water Benefit Accounting 2.0](#)

Eligibility Criteria: “Must Haves”

1. Established pathway for a **quantifiable** Volumetric Water Benefit
2. **Water challenges addressed** that are **relevant** to the catchment or area of interest
3. Internal **buy-in and general support** from external water resources entities
4. **Change delivered** beyond the without-project conditions that **would not have happened without the activity**
5. Established pathway to **track** project volumetric outputs
6. **Tradeoffs** assessed, understood and minimized

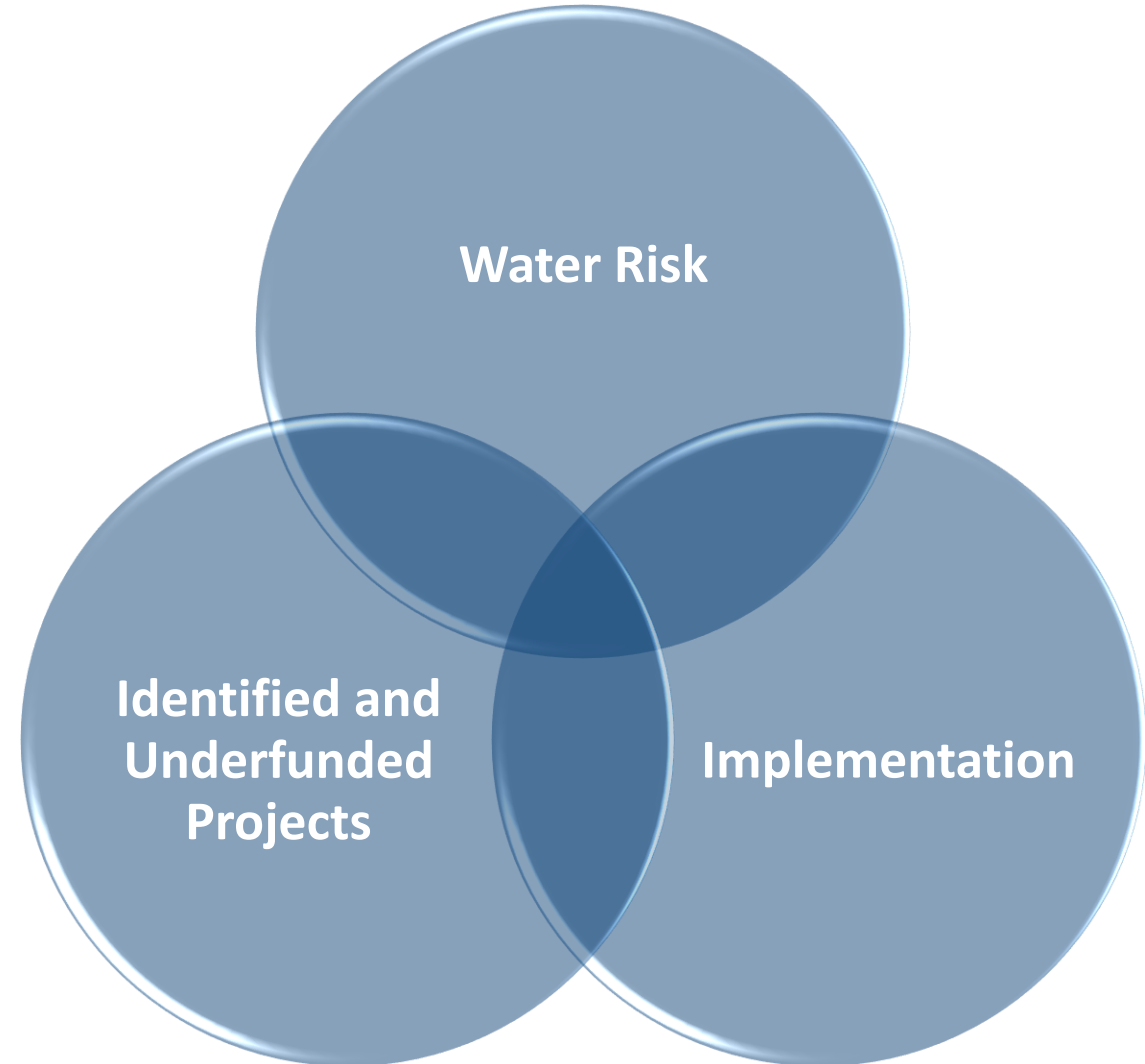

Project Selection Considerations: For Ranking and Prioritization

1. **Minimal risk** of project failure or underperformance
2. Project **implementer readiness** and capacity
3. Clarity on **project costs** and cost shares among funders
4. Feasible project **implementation timeline**
5. Anticipated **duration of VWBs** consistent with desired timeline
6. **Location relevant** to stewardship goals
7. Opportunity to deliver **multi-benefits**
8. **Enabling** projects
9. **Innovative strategies**
10. Opportunity for **collaboration**

CORPORATE-MUNICIPAL COLLABORATION

- Collaboration can happen multiple ways
 - Competitive RFPs from corporates
 - Direct collaboration with a corporate entity
 - Collaboration with non-profits
 - Project “scoping” by region

WHAT?

EXAMPLE PROJECTS

Stormwater Capture Project

| | |
|--------------------------------|---|
| Location | Atlanta, GA (on city land) |
| Shared Water Challenge | Localized flooding in an area with fallow land and abandoned |
| Activity | Stormwater management including rain garden, bioswales, underground detention system, development of park |
| Partners | City of Atlanta, Corporate Environment & Sustainability Group, Park Pride |
| Project Funding Support | 70% of funding provided by corporate partners |
| Co-benefits | Rejuvenation of the neighborhood, decreased pollutant loading to sewers/streams |

Site-Scale Green Infrastructure Project

| | |
|-------------------------------|--|
| Location | Chicago, IL (on public park land) |
| Shared Water Challenge | Runoff causing flooding |
| Activity | Revitalizing a bioswale and addition of rain gardens |
| Partners | Center for Neighborhood Technology, Chicago FarmWorks and others providing technical support and volunteer labor |
| Project Cost | Approximately 50% of funding provided by corporate partners |
| Co-benefits | Reduced runoff and erosion, improved surface water quality, improved green space, climate adaptation/mitigation |

TYPES OF QUANTIFIABLE PROJECTS

- Stream/wetland restoration
- Leak detection and repair
- Green infrastructure
- Dam removal
- Floodplain/side channel reconnection
- Flood mitigation (capturing volume)
- PS/NPS pollutant reduction
- Forest conservation / restoration
- Agricultural BMPs

DOEE CASE STUDY

GOOGLE RFI

- Constructed & operational by 2030
- At least 100 MGY
- Unit cost below \$12,000 per MGY
- Project costs must reflect
 - Implementation
 - Operations & maintenance
 - Reporting (and monitoring)

Project Evaluation Approach

Identify Possible Projects

Identified initial list of ~12 projects

Conduct High-level Screening Against Selection Criteria

Implementation schedule (prior to 2030)
Volume (100 MGY)
Below \$12,000 per MGY
Costs to include implementation, O&M, reporting & monitoring

Refine List of Projects

Selected 3 projects for more in-depth review

Conduct High-level Assessment

Determine method & indicator for assessment
Identify data needed for calculating preliminary volumetric

Select Final Project

Select project that best meets the selection criteria for submission in RFI/ other mechanism for submittal

Kingman Lake Project

Volume provided = Minimum flow during period of ecological significance for target species × Flow duration

- Volumetric Water Benefit is calculated as the in-stream habitat volume through the creation of habitat channels which are expected to benefit native river herring species (Alewife and Blueback Herring)
- Key inputs:
 - Minimum flow
 - 0.3-0.9 m/s (Greene et al, 2009) (Atlantic States Marine Fisheries Commission, 2009)
 - Period of ecological significance/flow duration
 - Assuming 90-day spawning period (Greene et al, 2009) (Atlantic States Marine Fisheries Commission, 2009)
 - Channel cross-sectional area (to determine total volume provided)
 - Assuming 0.75 ft average depth
 - Assuming average channel width by dividing channel area (30% design) by length for each channel

DRAFT 30% DESIGN FOR KINGMAN LAKE WETLAND AND RIVERINE RESTORATION AND HABITAT ENHANCEMENT - UPPER KINGMAN LAKE

DATE: 03/19/2025

SCALE: 1"=110'

AERIAL IMAGERY - GOOGLE EARTH 3/3/2024

CONSIDERATIONS...

- Is this type of opportunity right for your community?
 - If so, what types of limitations might you have to fund such a project (e.g., contractual, legal, perceived conflict of interest, optics)?
- What support might you need to identify projects?
 - Do you already have connections/partnerships with any corporates? What about NGOs?
- Do you have any shovel-ready projects?
- Do you need support in quantifying potential projects?
